

NQ Proprietary Intraday Futures Program

Preliminary Manager / Strategy Submission for aiSource Review

Submission status: Preliminary diligence package.

Performance status: Simulated / hypothetical internal replay.

Intended recipient: aiSource / managed futures diligence review.

Program objective: To evaluate whether the strategy merits further review as a systematic intraday futures program, subject to tick-level validation, broker-paper shadow execution, compliance review, and any applicable registration or advisory requirements.

Important Performance and Compliance Notice

The results presented in this document are simulated or hypothetical. They do not represent audited live trading, actual client account performance, or registered CTA performance. Hypothetical results have material limitations and may not reflect all market-impact, liquidity, slippage, operational, psychological, technology, exchange, or implementation risks.

This document is provided for preliminary diligence discussion only. It should not be distributed to investors, relied upon as an offer document, or used as marketing material unless reviewed and approved by qualified compliance counsel. Any required CFTC/NFA prescribed hypothetical-performance language should be inserted before external distribution.

Executive Summary

The NQ Proprietary Intraday Futures Program is a systematic, intraday, Nasdaq futures strategy designed to capture directional early-session momentum while maintaining capped exposure, predefined risk controls, partial exits, and end-of-session flattening.

The program has been evaluated through an internal broker-like replay framework over the period **March 4, 2021 through March 6, 2026**. The current review package is intended to determine whether the program is suitable for deeper diligence, including tick reconstruction, broker-paper shadow trading, execution validation, and potential pathway assessment for managed futures deployment.

Metric	Value
Program	NQ Proprietary Intraday Futures Program
Primary instrument	NQ futures
Performance type	Simulated broker-like internal replay
Test window	2021-03-04 to 2026-03-06

Metric	Value
Starting model equity	\$1,000,000
Ending model equity	\$2,184,585
Net return	118.5%
CAGR	16.9%
Max intrabar stress drawdown	\$-53,847 / -5.4% of initial equity / -2.6% peak-to-trough
Max closed drawdown	\$-53,172 / -5.3% of initial equity / -2.6% peak-to-trough
Profit factor	2.65
Campaign win rate	69.3%
Net / stress drawdown	22.00
Sharpe / Sortino	3.25 / 4.58
Campaigns / unit exits	352 / 1,760
Equity and drawdown	

Strategy Overview

The program trades **NQ futures** using a proprietary multi-timeframe intraday signal process. The strategy is designed around early-session directional conditions, a directional gate, and a later opposing price-confirmation trigger.

The strategy is rules-based and causal. Entry conditions are evaluated only after required data is available, and orders are armed only after confirming bars have closed. The program is intended to avoid discretionary intervention, overnight exposure, and uncontrolled position escalation.

Core design features

- Instrument: **NQ futures**.
- Trading style: systematic intraday futures.
- Signal family: proprietary multi-timeframe directional and confirmation framework.
- Session profile: early-session opportunity capture with session-end flattening.
- Risk controls: capped intraday exposure, predefined stops, partial exits, and protective stop management.
- Execution model: internal order-lifecycle replay with causal order activation.
- Replay assumptions: 1-tick adverse slippage on market/stop fills, stop gap-through fills, stop-first same-bar ambiguity, and \$1.50 fee per closed unit.

Exact signal formulas, timing parameters, and sizing maps are intentionally omitted from this preliminary submission. They can be reviewed separately under appropriate diligence and confidentiality arrangements.

Performance Profile

The program produced positive net simulated results in each calendar year of the test window. The weakest year was **2022**, which remained positive but showed materially lower performance quality, with \$13,425 net profit and a 1.17 profit factor.

Year	Campaigns	Net	Win %	PF	Closed DD	Net/DD
2021	77	\$273,142	72.7%	3.74	\$-10,815	25.26
2022	16	\$13,425	56.2%	1.17	\$-31,382	0.43
2023	73	\$168,292	68.5%	2.43	\$-34,652	4.86
2024	93	\$199,522	64.5%	1.89	\$-24,945	8.00
2025	74	\$399,000	71.6%	4.09	\$-22,815	17.49
2026	19	\$131,202	84.2%	5.70	\$-15,465	8.48

Monthly returns

Robustness and Risk Review

The strategy has been reviewed for several first-order robustness concerns, including weak-period behavior, winner concentration, rolling campaign quality, and event-day sensitivity.

Key observations:

- The weakest calendar year was **2022**, with \$13,425 net and 1.17 profit factor.
- Rolling 50-campaign profit factor did not fall below 1.0 in the robustness audit.
- The top 10 winning campaigns accounted for approximately 28% of total net profit.
- Removing the top 10 winning campaigns still left the strategy positive in the robustness review.
- CPI/FOMC skipping did not improve the base result; the event-study base remained \$1,184,585 with 25.60 reconstructed Net/Stress.
- The first identified risk-control lever is reduced sizing in the widest early-session range bucket. The internal reduced-size variant kept \$1,137,539 net profit and improved reconstructed Net/Stress to 30.04.

The current interpretation is that the program does not appear to be solely dependent on a small number of extreme outliers, but it does require further execution-level validation before any capital-allocation conclusion can be made.

Cross-Market Read

The signal family was also reviewed across related equity-index futures markets. NQ remains the strongest expression of the strategy, but the broader cross-market results provide some support that the edge is not isolated to one contract only.

Market	Campaigns	Net	Stress DD	Win %	PF	Net/Stress
NQ	352	\$1,184,585	\$-53,847	69.3%	2.65	22.00
MNQ	353	\$113,548	\$-5,418	68.6%	2.52	20.96
YM	347	\$320,190	\$-26,835	59.6%	1.85	11.93
ES	245	\$348,688	\$-33,164	63.7%	2.08	10.51
MYM	333	\$26,054	\$-2,665	59.8%	1.71	9.78

This cross-market review is not presented as evidence of tradeable multi-market deployment. It is included to show that the underlying behavior has some related-market confirmation and may warrant further investigation.

Execution and Implementation Status

The current replay framework has passed the fill-book causal audit for the NQ base row. All **352 / 352** qualifying campaign entries passed the causal-entry review, with **0** causal violations identified.

However, the strategy is **not yet tick-proven**. The current NQ execution-scrutiny review classifies the campaigns as follows:

Execution review category	Campaigns
Bar-safe	141
Same-minute ambiguous	45
Requires deeper sequence review	166

The one-minute execution review is encouraging but incomplete. Most non-bar-safe campaigns later revisit the relevant price zone, with one rough no-later-touch case identified. The next diligence step is therefore not rule optimization, but execution validation.

Required next steps:

1. Tick-level reconstruction of ambiguous and sequence-sensitive campaigns.
2. Broker-paper shadow mode using live market data and actual platform order handling.

3. Comparison of expected versus observed fills, slippage, latency, rejected orders, and partial-fill behavior.
 4. Independent review of sizing assumptions, margin usage, liquidity, and operational controls.
 5. Compliance review before any investor-facing or CTA-related presentation.
-

Current Diligence Request

This submission is intended to determine whether aiSource would be open to reviewing the program as an early-stage systematic intraday futures strategy candidate.

The specific diligence request is not an immediate allocation request. The requested next step is a structured review of:

- whether the return/risk profile is of interest;
 - whether the strategy category fits aiSource's managed futures review process;
 - what additional documentation would be required;
 - whether broker-paper tracking would be useful;
 - what registration, disclosure, CTA, or operational requirements would need to be satisfied before the strategy could be considered externally.
-

Materials Available for Review

The following supporting materials are archived internally and can be provided in a controlled diligence process:

- replay logs;
- campaign-level trade exports;
- equity and drawdown chart packs;
- execution-scrutiny reports;
- robustness and reduced-sizing variants;
- annual and monthly performance summaries;
- refresh scripts and audit notes;
- methodology summary under NDA or appropriate confidentiality process.

Raw source paths and full signal logic are not included in this preliminary document. They can be made available only under an agreed diligence framework.

Summary

The NQ Proprietary Intraday Futures Program is a systematic intraday futures strategy with attractive simulated performance, strong base-case risk-adjusted metrics, positive cross-market confirmation, and clear next-step diligence requirements.

The program is not being presented as audited live CTA performance. It is being submitted as a candidate for deeper review, with the understanding that tick-level execution validation, broker-paper shadow tracking, operational review, and compliance assessment are required before any external use or investor-facing representation.

The immediate request is feedback on whether the strategy profile is suitable for aiSource's review process and what materials would be required to advance the diligence discussion.
